

includes any power disturbance event that poses a threat to the continuous operation of the equipment in question. After completion of the site survey, the power system engineer will identify any system problems and recommend action for their elimination. Recommendations typically include uninterruptible power supplies, power conditioning devices,

Key Features. Automatic Voltage Regulation (AVR) - Stabilizes incoming AC power by boosting low voltages and trimming high voltages so connected devices get the voltage they were designed to use (nominal 120V or 220-240V, depending on your country). Voltage regulation is sometimes called "buck and boost". "Let-Through" Rating - The let-through voltage rating refers to the ...
