

Will electric vehicle batteries satisfy grid storage demand by 2030?

Renewable energy and electric vehicles will be required for the energy transition, but the global electric vehicle battery capacity available for grid storage is not constrained. Here the authors find that electric vehicle batteries alone could satisfy short-term grid storage demand by as early as 2030.

Can EV batteries supply short-term storage facilities?

For higher vehicle utilisation, neglecting battery pack thermal management in the degradation model will generally result in worse battery lifetimes, leading to a conservative estimate of electric vehicle lifetime. As such our modelling suggests a conservative lower bound of the potential for EV batteries to supply short-term storage facilities.

Are battery energy storage systems the future of electricity?

In the electricity sector, battery energy storage systems emerge as one of the key solutions to provide flexibility to a power system that sees sharply rising flexibility needs, driven by the fast-rising share of variable renewables in the electricity mix.

Are 'second-life' electric vehicle batteries a viable option?

"Second-life" electric vehicle batteries are projected to play an increasingly important role, providing an option to cheaply expand stationary battery energy storage.

Why is battery energy storage a key technology in light-duty vehicles?

Battery electric vehicles become the dominant technology in the light-duty vehicle segment in all scenarios. In the electricity sector, battery energy storage emerges as one of the key solutions to provide flexibility to a power system that sees sharply rising flexibility needs, driven by the fast-rising share of variable renewables.

What are the different types of battery energy storage systems?

Battery storage systems can be distinguished between two classes: utility-scale battery energy storage systems and behind-the-meter battery energy storage systems. Utility-scale battery energy storage systems are directly connected to the distribution or transmission systems.

In 2023, a medium-sized battery electric car was responsible for emitting over 20 t CO<sub>2</sub>-eq over its lifecycle (Figure 1B). However, it is crucial to note that if this well-known battery electric car had been a conventional thermal vehicle, its total emissions would have doubled. 6 Therefore, in 2023, the lifecycle emissions of medium-sized battery EVs were more than 40% lower than ...
