

One bad cell or one bad battery can destroy a large, expensive battery bank. A short circuit or high internal leakage current in one cell for example will result in undercharge of that cell and overcharge of the other cells. Similarly, one bad battery in a 24V or 48V bank of several series/parallel connected 12V batteries can destroy the whole ...

The FFH all-fluorinated electrolyte can form a robust and stable LiF-enriched interphase for ameliorating the dendrite growth and realizing high-voltage operations. The assembled battery has achieved a high cycling stability for more than 1000 h with a desirable Coulombic efficiency of 97.1% for Li-metal plating/stripping.
