Are Sungrow solar inverters suitable for utility-scale installations?

Explicitly designed for utility-scale installations, our advanced utility-scale solar inverters ensure reliable operation, maximize energy generation and enable seamless grid integration. Sungrow PV system solutions are suitable for different application scenarios, including residential, commercial, and utility-scale PV systems.

Are microinverters rated for utility-scale voltages?

Since microinverters are not rated for utility-scale voltages, we will largely ignore them in this article. String inverters convert DC power from "strings" of PV modules to AC and are designed to be modular and scalable. Smaller string inverters may have as few as one input, with one PV string per input.

What is a central inverter?

The inputs to central inverters are most often combined DC circuits from many (or all) strings in the array that feed a small number of integrated MPPTs. The likelihood of encountering a central inverter on a project increases with project size and age. Utility-scale projects above ~10 MW are the most common application today.

How many kilowatts can a PV inverter handle?

Pad-mounted central inverter co-located with a medium-voltage transformer. The first PV inverters were developed in the 1980s as a spinoff of drive system technologies. At the time, all models could be considered central inverters rated to handle no more than a few kilowatts. As with any new technology, early iterations were far from perfect.

Why are utility-scale developers switching to string inverters?

Some utility-scale developers are switching to string inverters due to: Lower operational expenditure (OPEX): A smaller form factor means smaller parts, shorter spare parts lists, and simpler repairs. No special training or heavy machinery is required to repair most string inverters.

How many kilowatts can a string inverter run?

Currently, developers can source string inverters rated for upwards of 350kW per unit. Many string inverter manufacturers offer skidded or cluster-mounted solutions that co-locate hundreds of kilowatts of string inverters into a "virtual central inverter" configuration.
