ects in Uganda - 40 percent and 34 percent re-spectively (Figure 100). Almost 70 percent of the projects are privately-owned while over a quarter are owned, operated and managed by local com-munities (Figure 101). A number of private developers are currently oper-ating in Uganda"s mini-grid market or plan to enter soon (Figure 102).

This handbook deals with emergent topics related to embedding artificial intelligence (AI) into electrical grids. Smart grids are cyberphysical-social systems, which include information and communication technology (ICT), computer-implemented human concepts and actions, sensors, controllers, distributed energy resources, and social and economic issues. ...

Therefore, it is very important to have smart grid technologies that can update and communicate in real-time. If a power surge spikes, the smart grid has to be ready to distribute that power throughout the system. There are currently many plans that have been proposed to help design a smart grid system that has renewable energy sources.

In a smart grid, distributed energy generators are expected to play an important role in providing cost-effective and green energy-services to customers. Implementation of wind farms and solar panels are two popular

distributed energy generating sources. In addition to this, combined heat power (CHP) and fuel cells are also expected to take ...

The World Bank's Mini Grids for Half a Billion People: Market Outlook and Handbook for Decision Makers notes that to realize the full potential of solar mini grids, governments and industry must work together to systematically identify mini grid opportunities, drive costs down, and overcome barriers to financing.
